pnpm verify: ALL GREEN · typecheck 4/4 · lint 0 fails (130 any-warns) · unit 339/339 · scenes 36/36.
Caveats: grill-screen Playwright capture-timing artifact (p5); mobile chrome dense but functional at 390px.

Baseline project map

scene: project-map

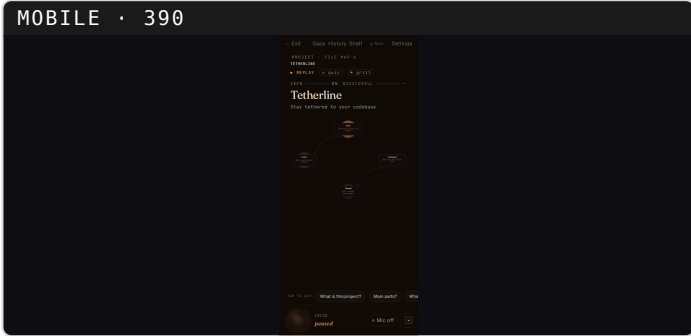

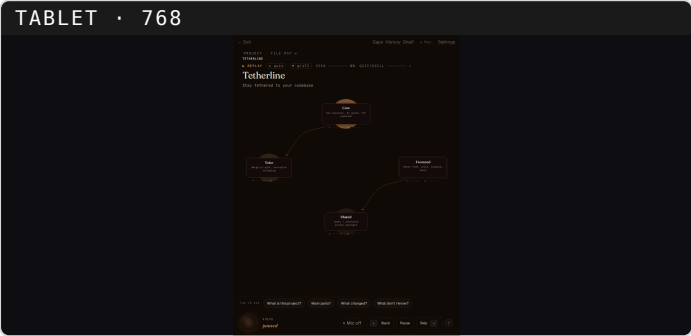

The default radial map with no skill active. Module nodes orbit the project; each node is warm-lit by how well the user understands it (comprehension level). Header, knowledge legend, quick-chips and the voice bar are the persistent chrome.

whats_changed — "what moved this week" heatmap

scene: heatmap

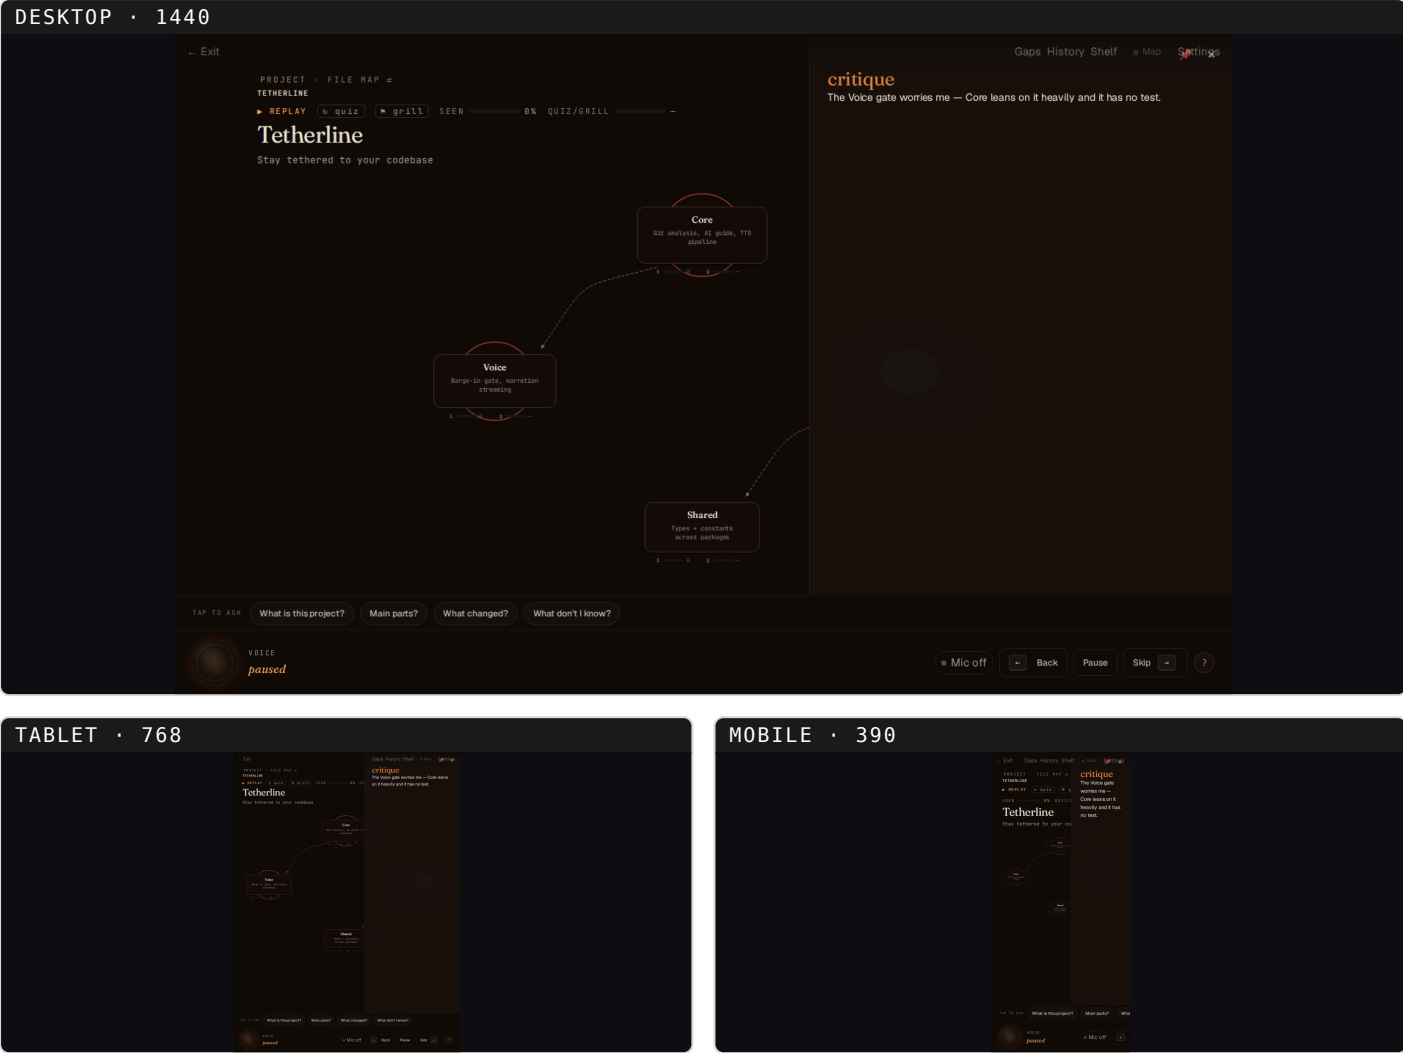

A cold → warm field over the map driven by REAL git change magnitude (commits/file last ~30d, from the existing computeHeatmap data): Core hot (18), Voice medium (5), Shared faint (1), Frontend untouched → no wash. Recap is narration-only — the raw skill-id "document" card is suppressed; the diagram IS the visual. Additive overlay, never replaces structure.

critique — concern tint

scene: concern-tint

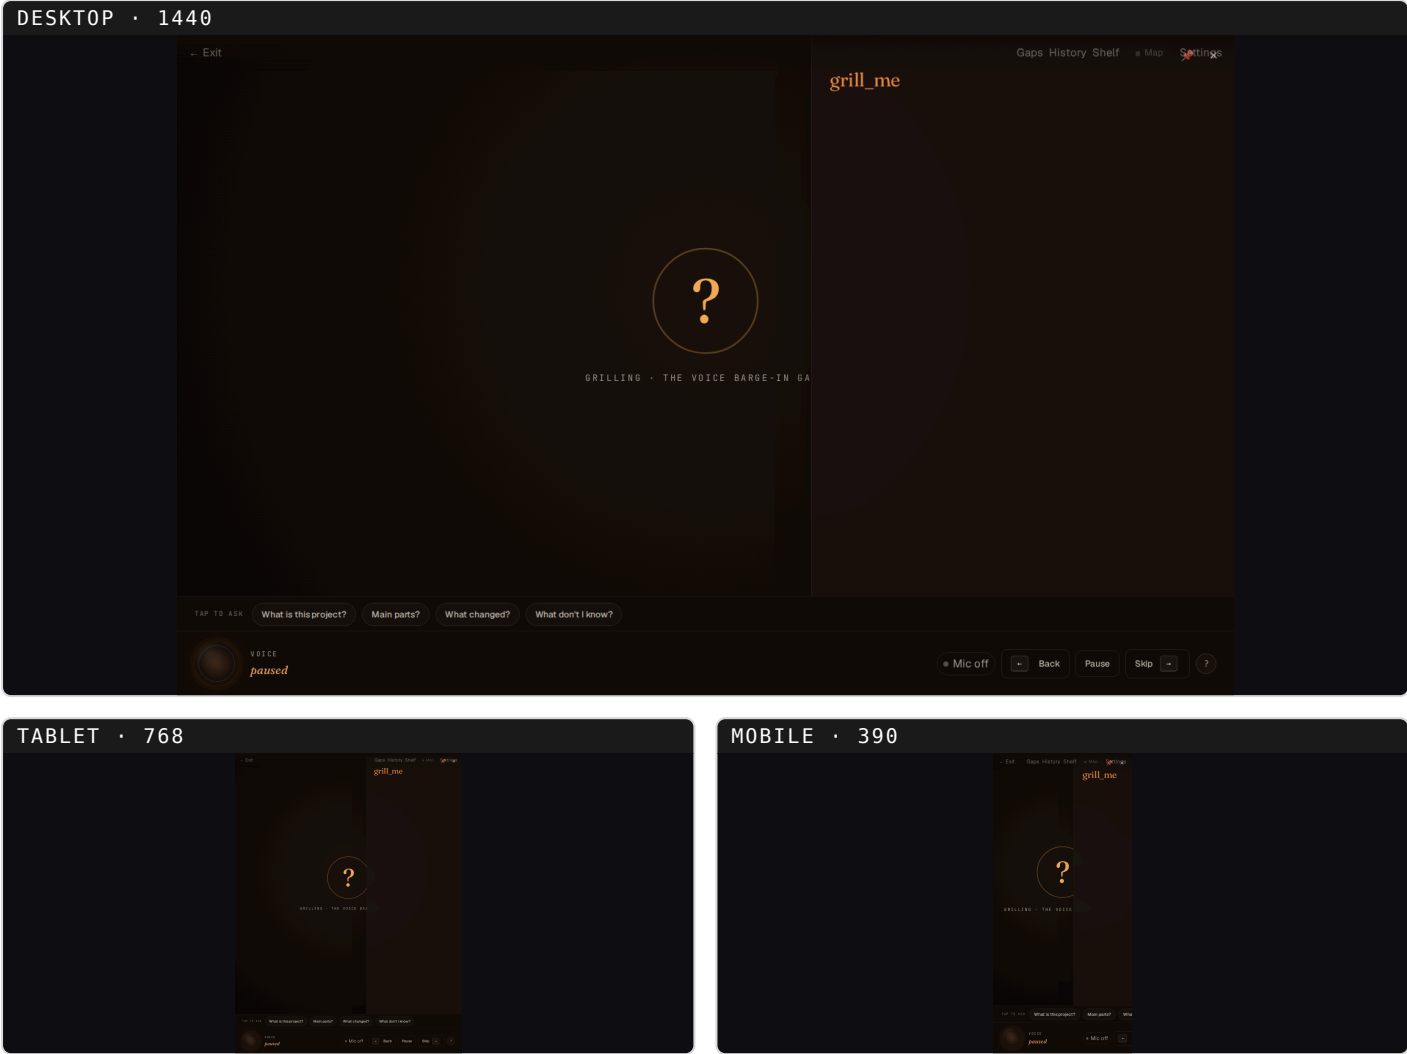

The spoken critique names risky nodes; those nodes glow worry-red (an intentional signal color) while the critique narration is shown. Additive tint, layout unchanged.

grill_me — quiz screen

scene: grill-screen

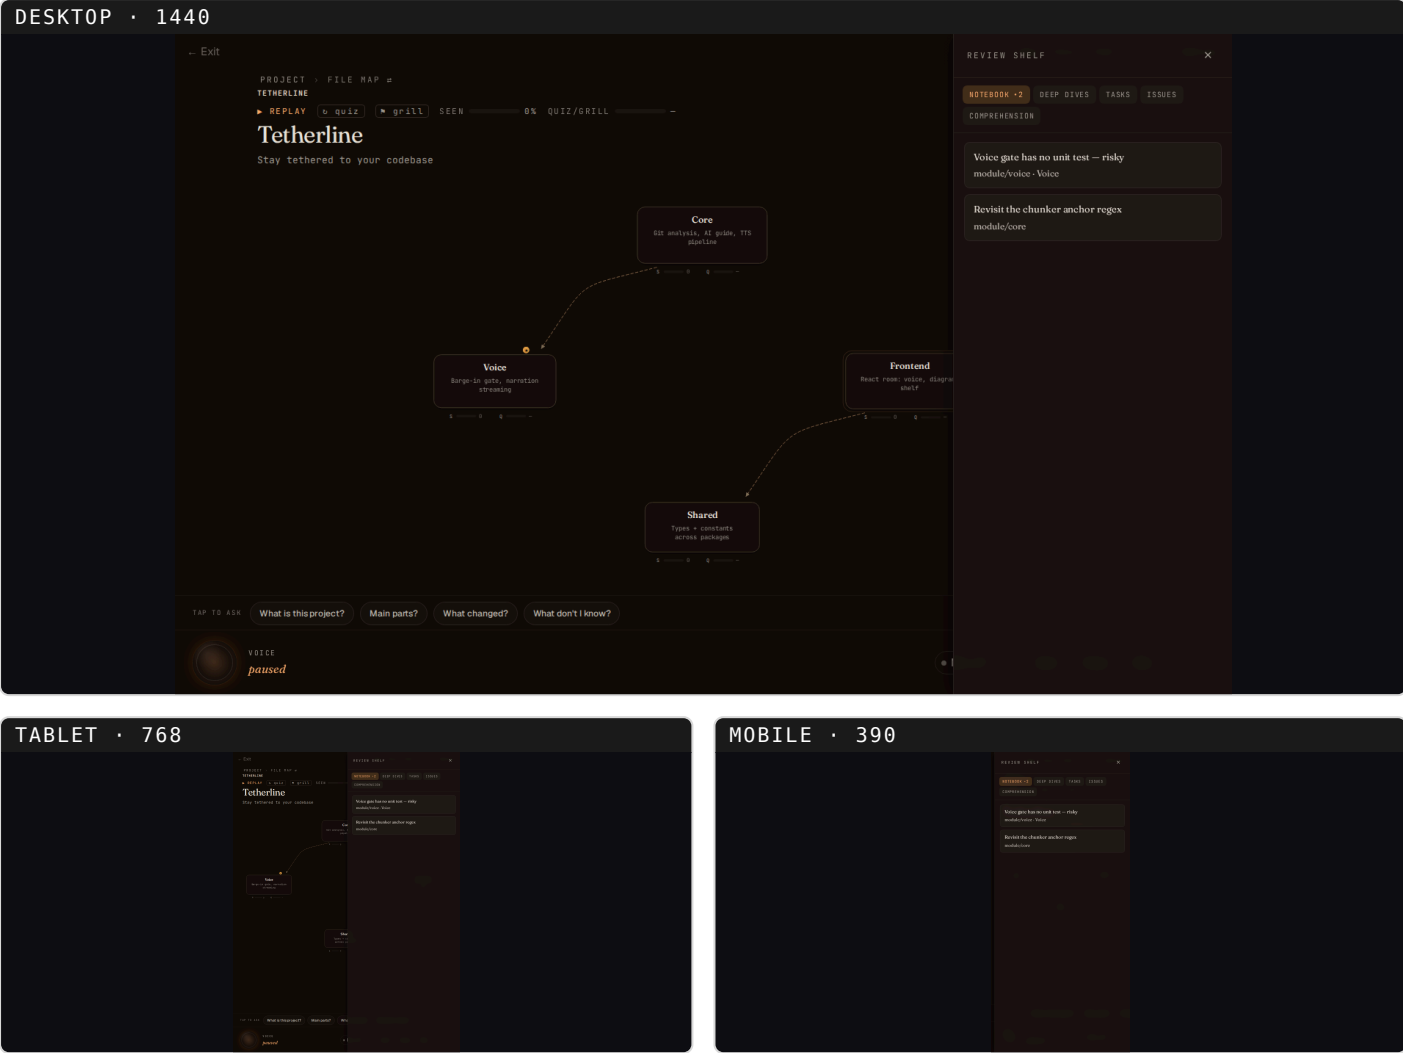

A calm, full-bleed animated "?" screen replaces the diagram for a Socratic quiz. CAVEAT: under Playwright fresh-context capture timing the text "grill_me" / the GRILLING caption can briefly leak into the frame; the live settled DOM is clean (diagram fully replaced). Documented timing artifact, not a live defect.

annotate — Review Shelf · Notebook

scene: shelf-notes

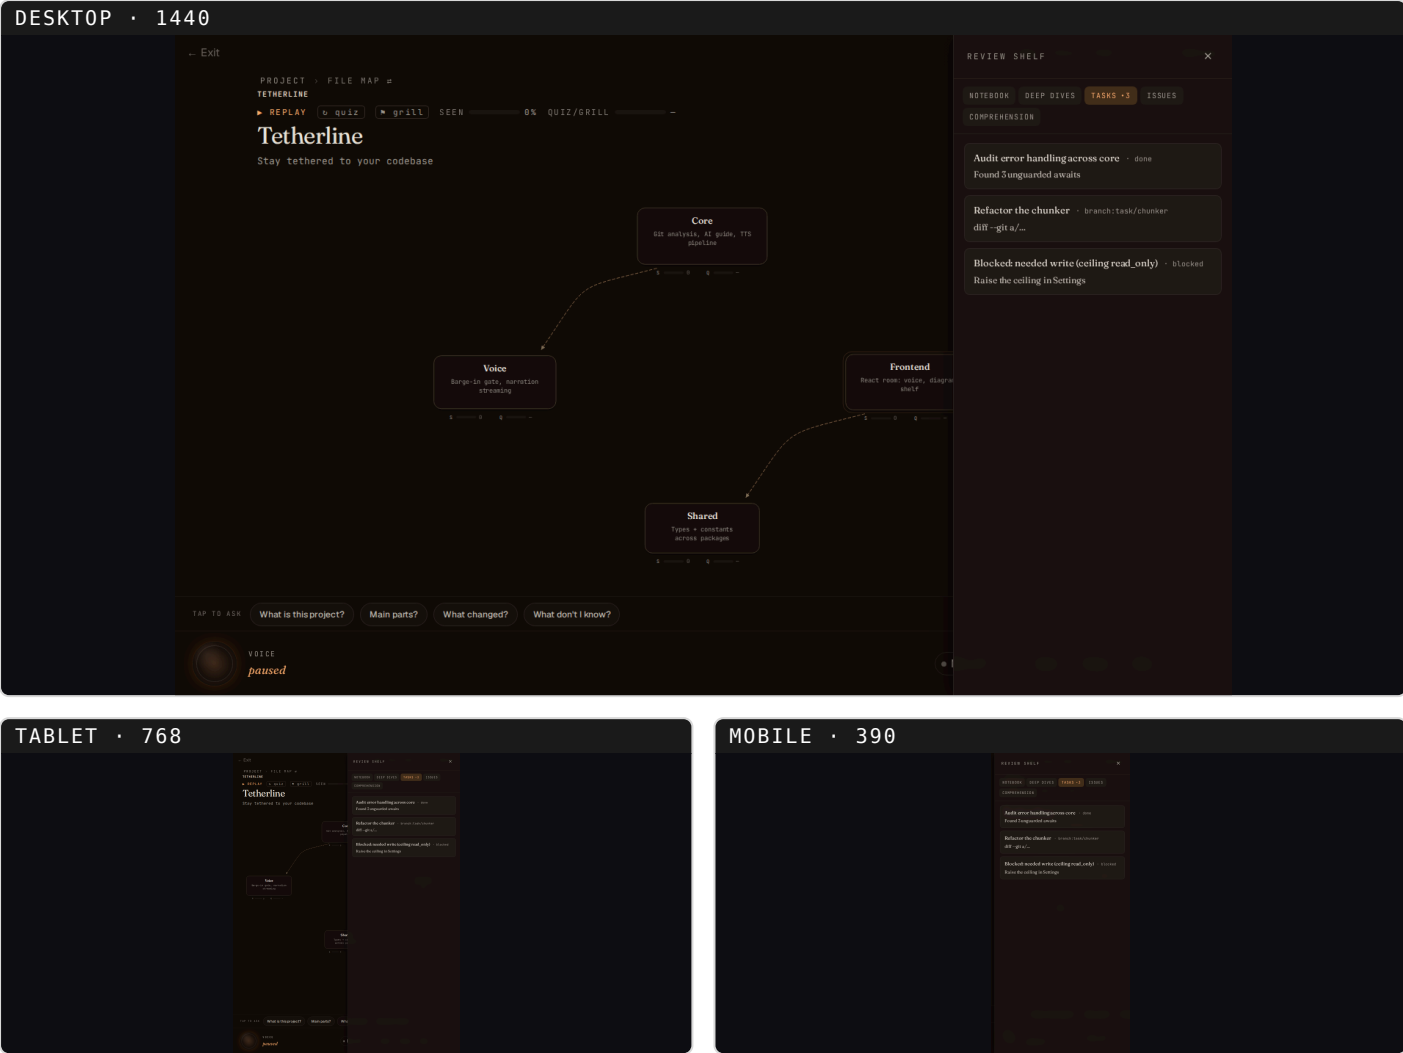

The Review Shelf open on the NOTEBOOK tab with saved annotations, each attributed to a module/file. The diagram stays intact behind the shelf overlay.

Async task skill — Review Shelf · Tasks

scene: shelf-tasks

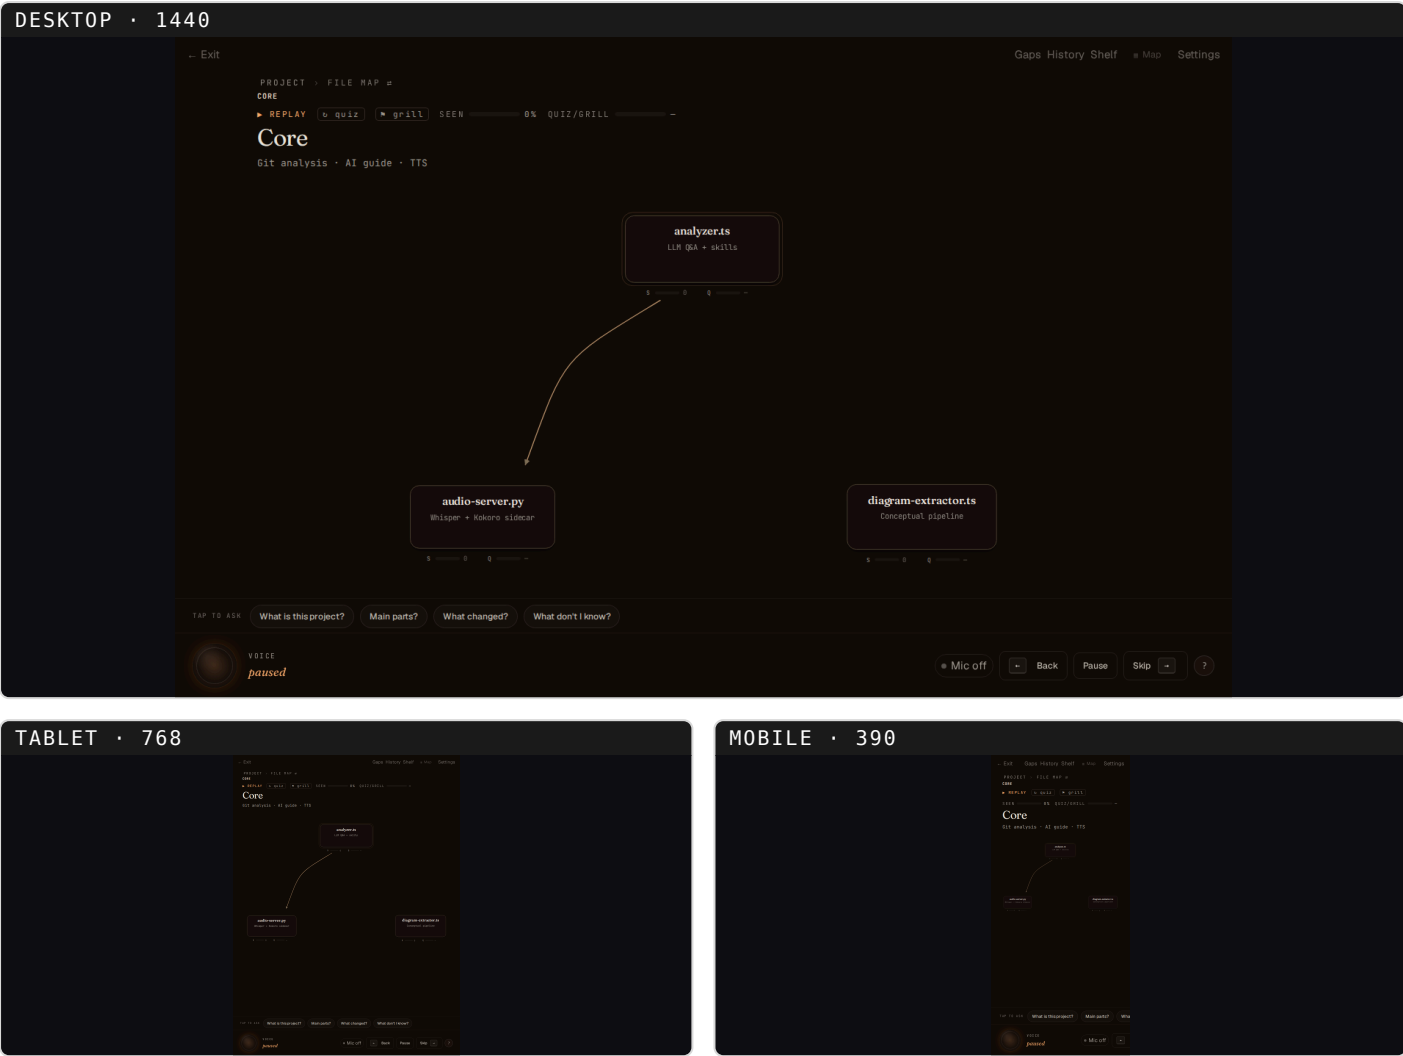

The Review Shelf TASKS tab: agent task rows with state styling — done, branch:<x>, and blocked.

DESCEND — scoped drill-in

scene: descend

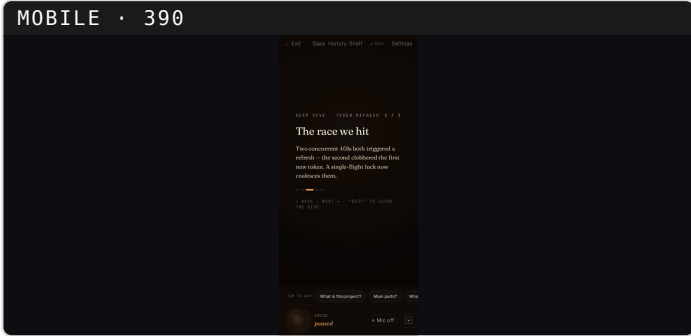

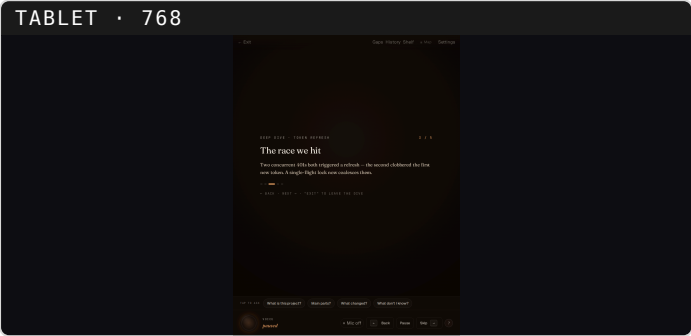

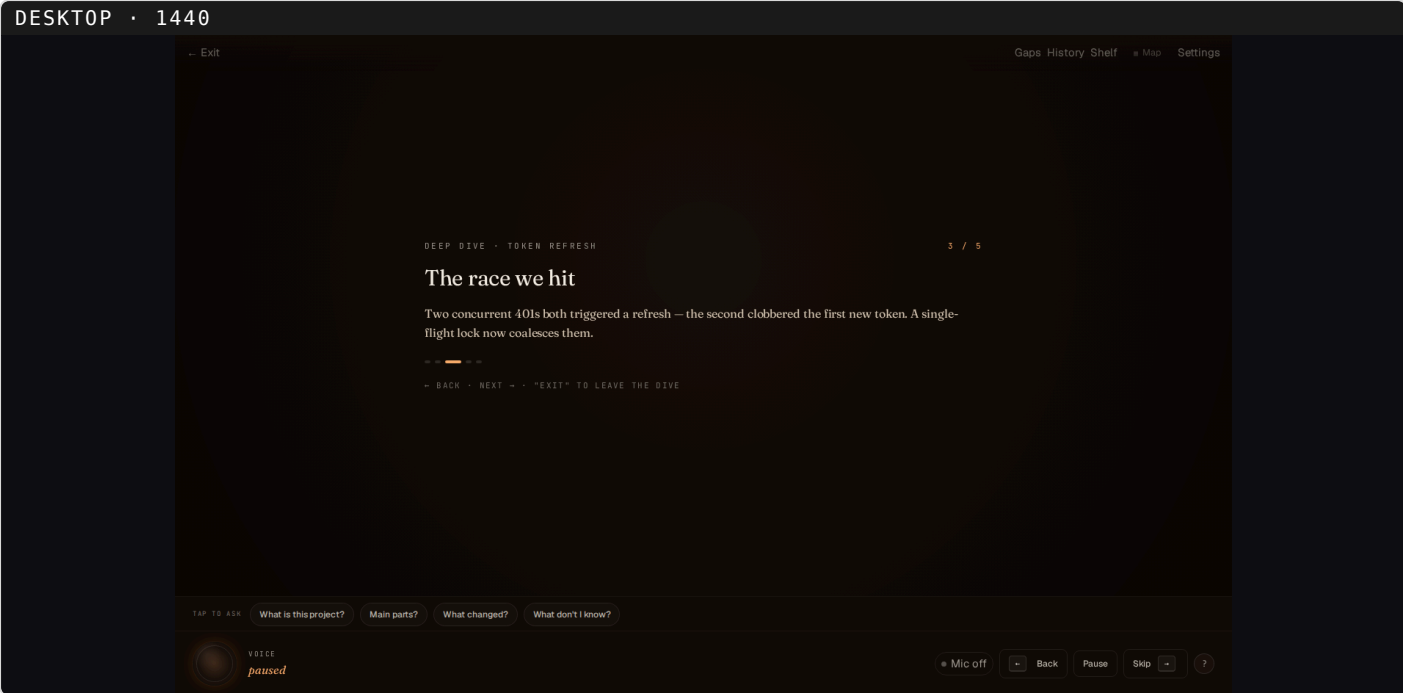

Drilled from the project into the Core module: a scoped sub-graph (analyzer.ts / audio-server.py / diagram-extractor.ts) with the breadcrumb, retitled header and intra-module edges.

deep_dive — pocket presentation

scene: deep-dive

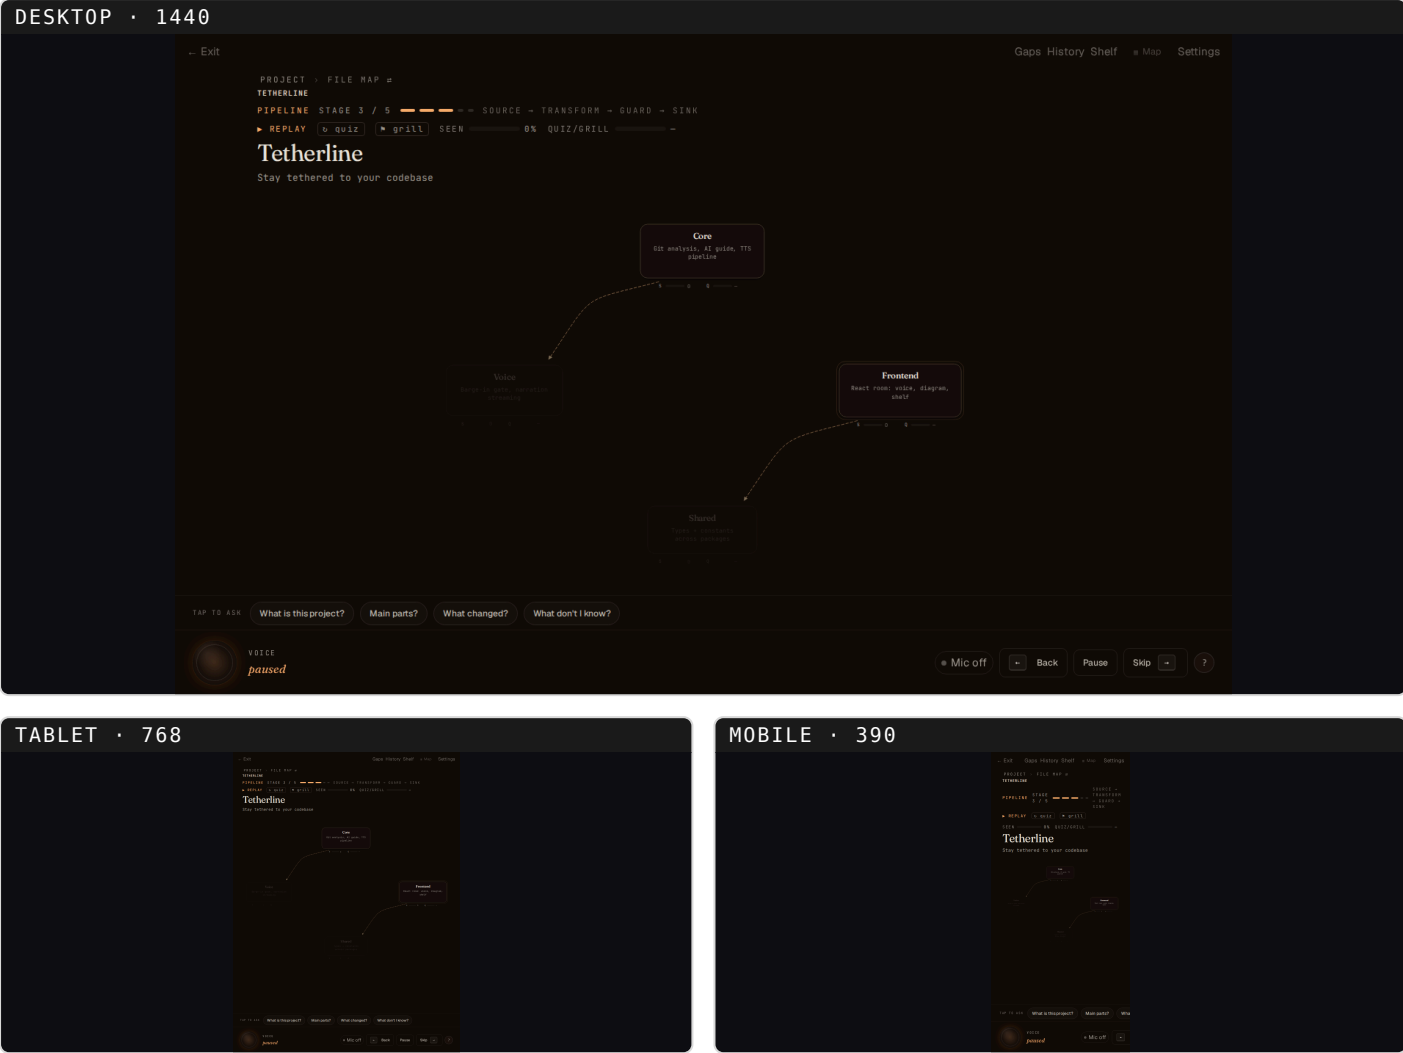

The "pocket dimension": a full-bleed ≤ 10 -slide presentation that replaces the diagram (sandbox; exiting restores the canvas). Kicker · focus, N/M cursor, serif title + body, amber slide rail, exit hint. Slides ride on the pocket state, not a skill annotation, so the canvas is clean full-bleed.

Pipeline walkthrough

scene: pipeline

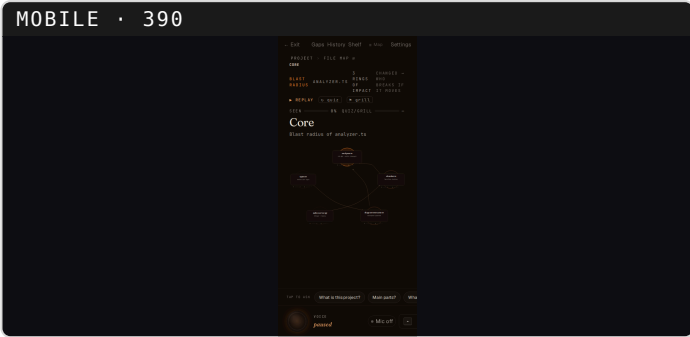

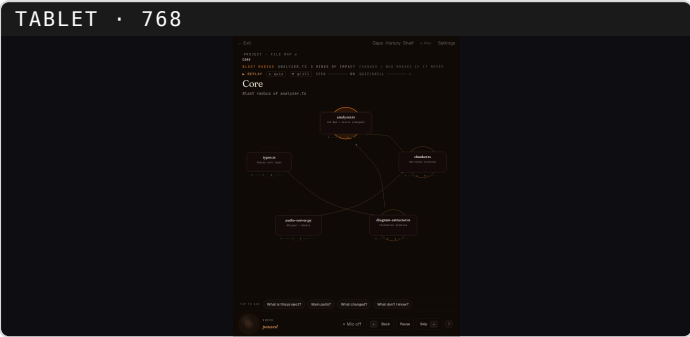

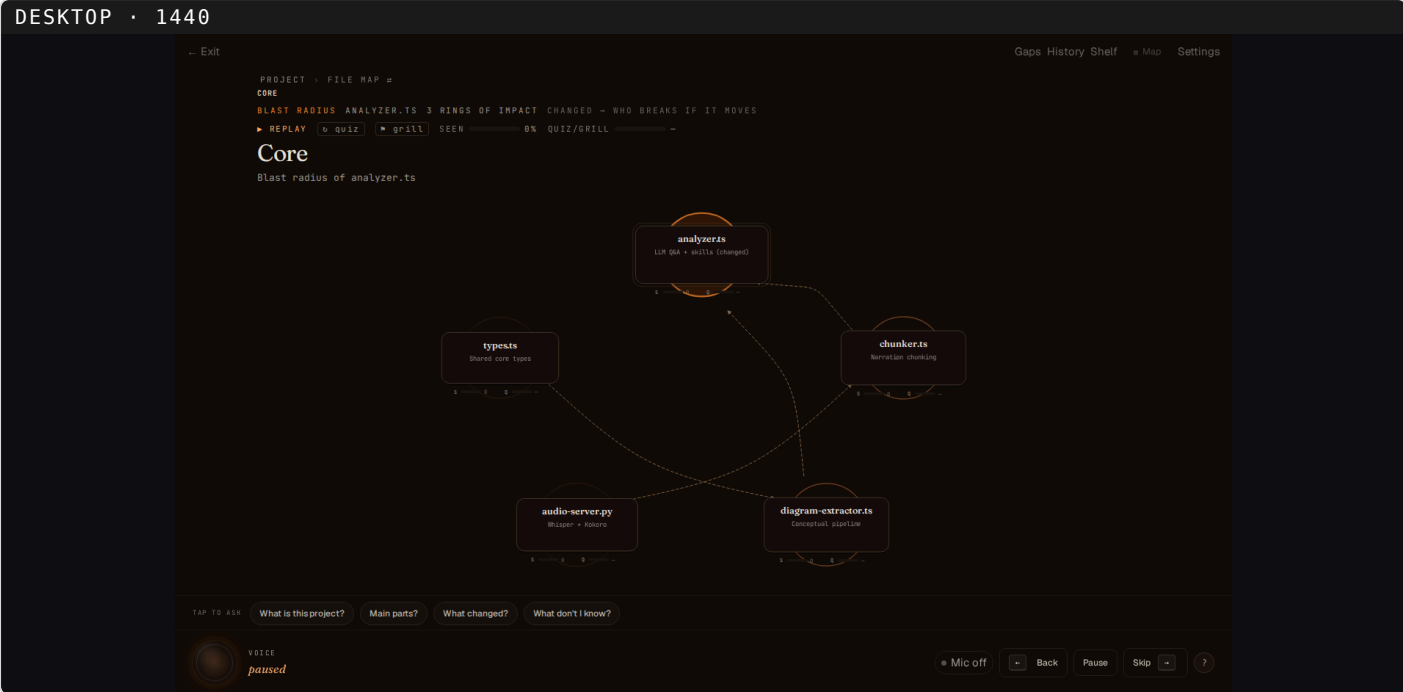

"Show me the data flow" lights the graph one stage at a time in source → transform → guard → sink order; revealed nodes are lit, not-yet-revealed are dimmed. Header shows the stage strip. Reuses the tested pipelineRevealOrder core.

Blast-radius ripple

scene: blast-radius

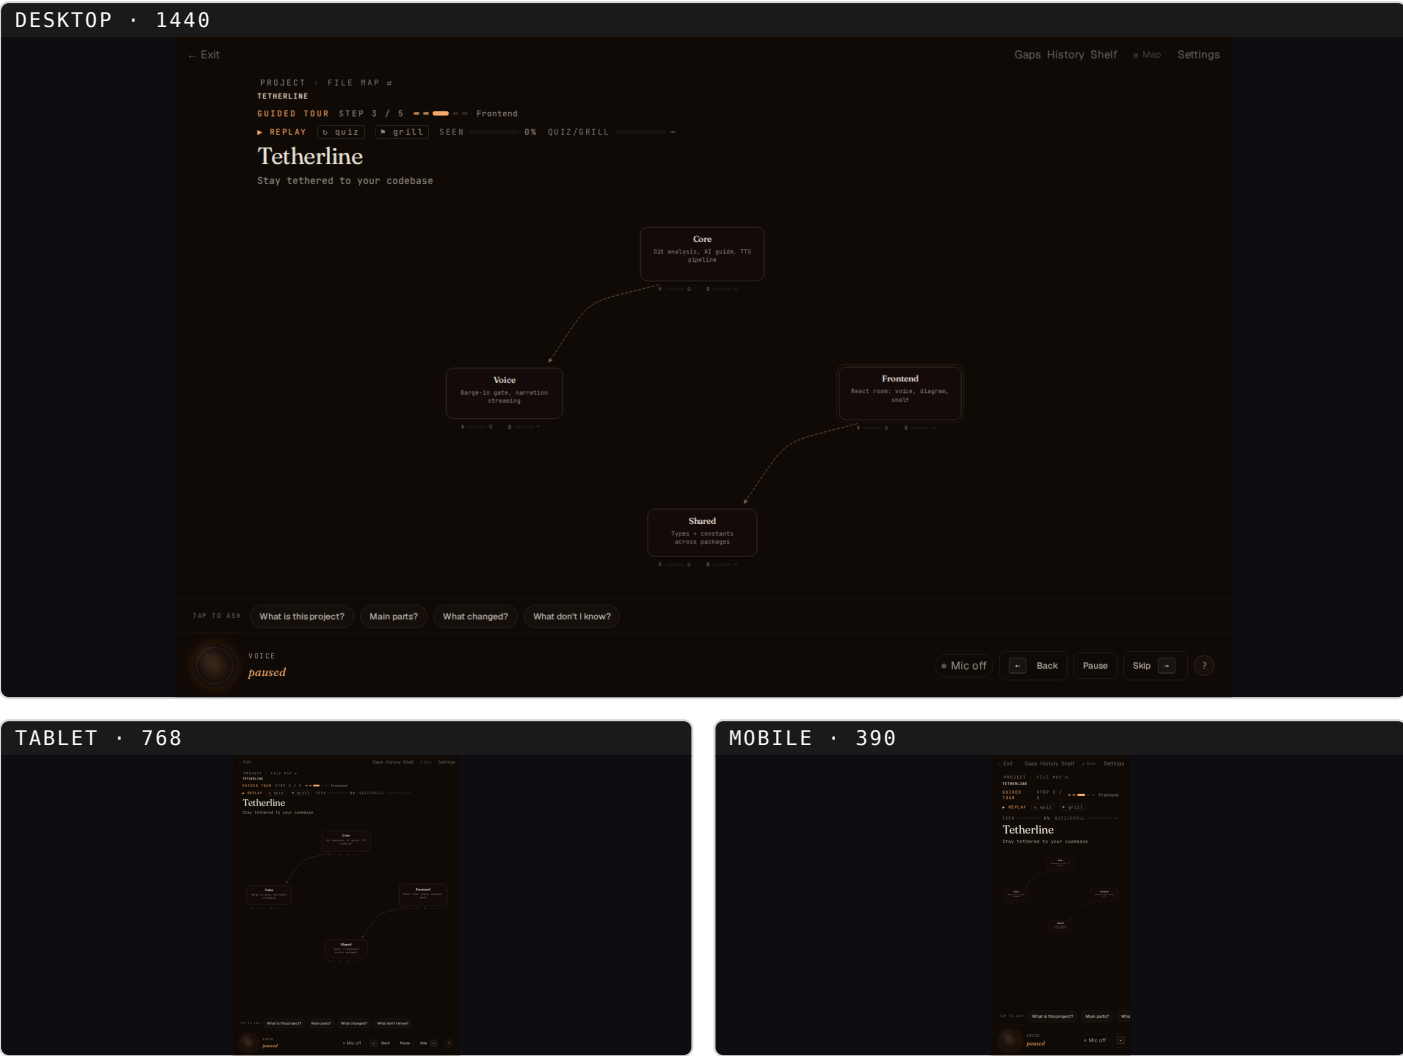

"What touches X" BFSes the import graph from the changed node and pulses concentric impact rings: hop 0 = solid warm epicenter, fading outward by hop distance. Reuses the tested blastRadiusRings core.

Guided-learning mode

scene: guided-mode

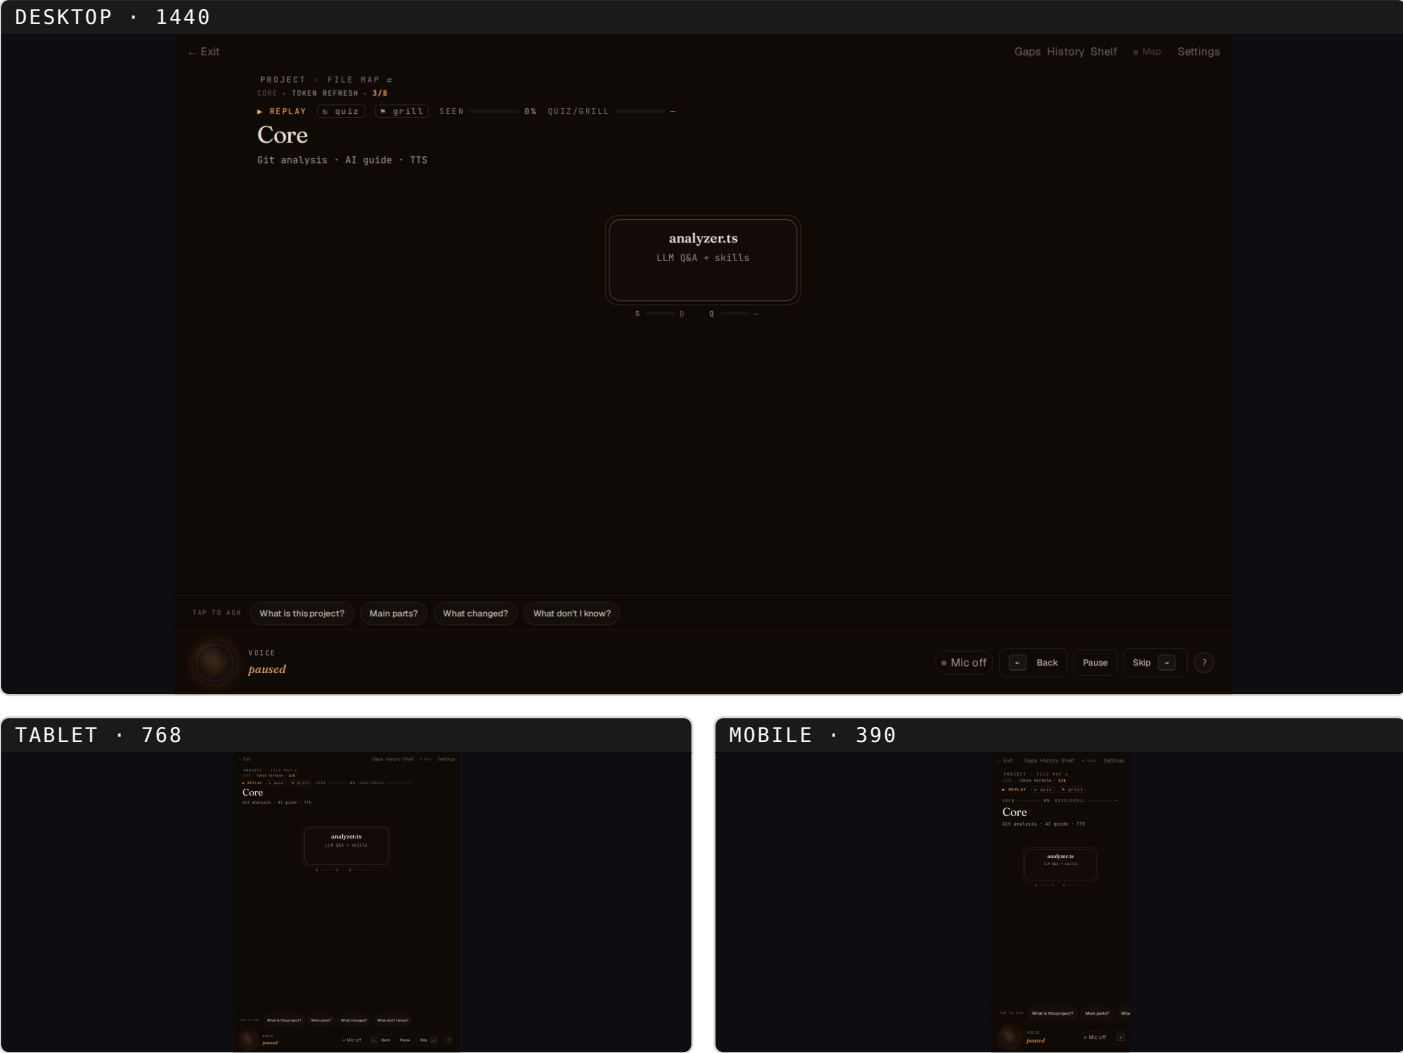

A top-down guided tour: header spine of covered ► current (wide amber) ► upcoming steps, with the current step name. Mirrors the tested TourPlan.fromArchitecture {items,currentIndex} shape.

You-are-here breadcrumb

scene: breadcrumb

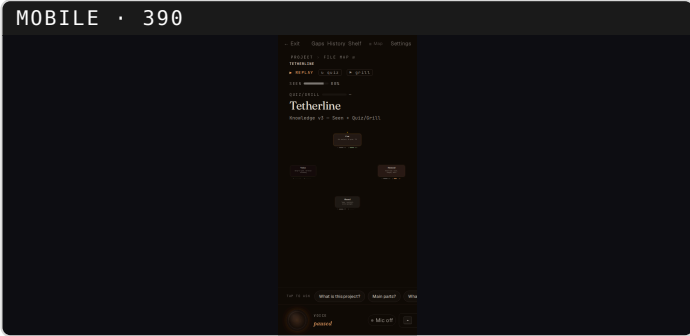

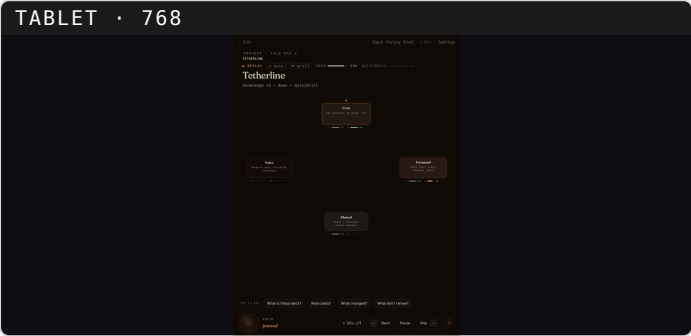

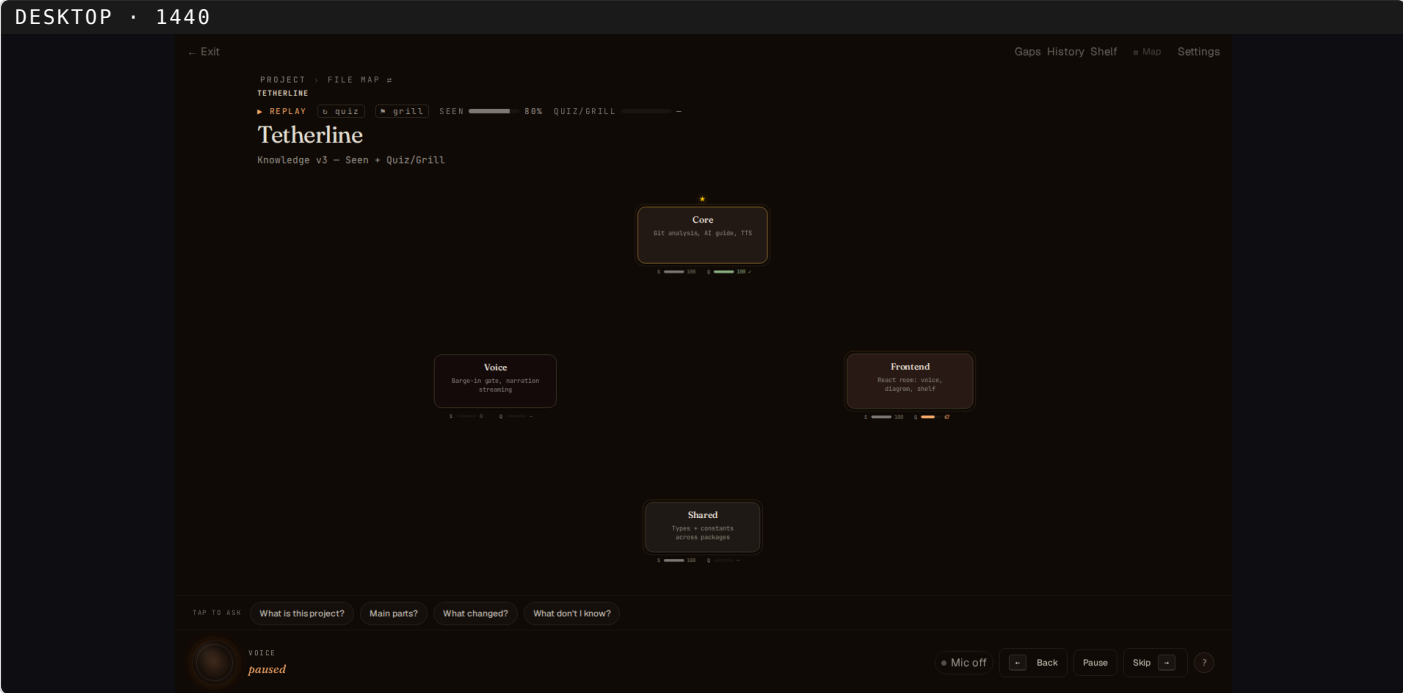

The persistent "you are here" position trail (e.g. CORE › TOKEN REFRESH › 3/8) shown in the header inside a deep_dive pocket, over the scoped canvas.

Knowledge v3 — Seen + Quiz/Grill

scene: knowledge-layer

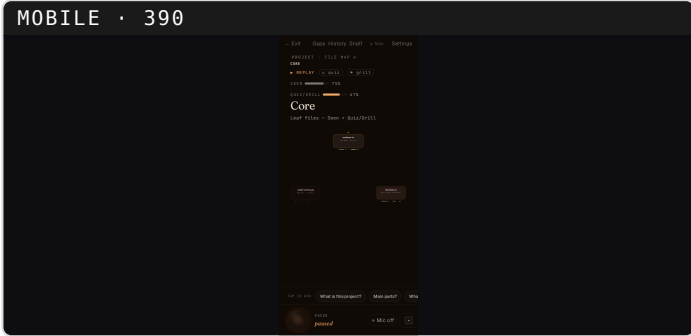

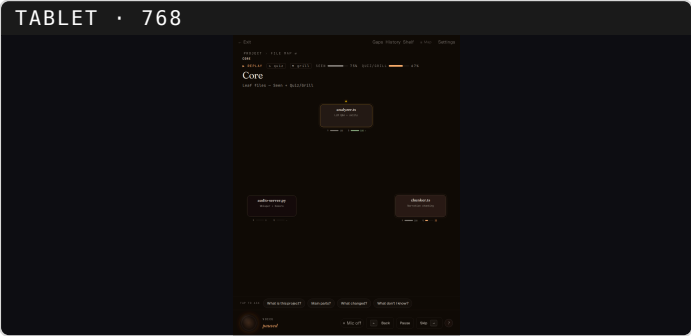

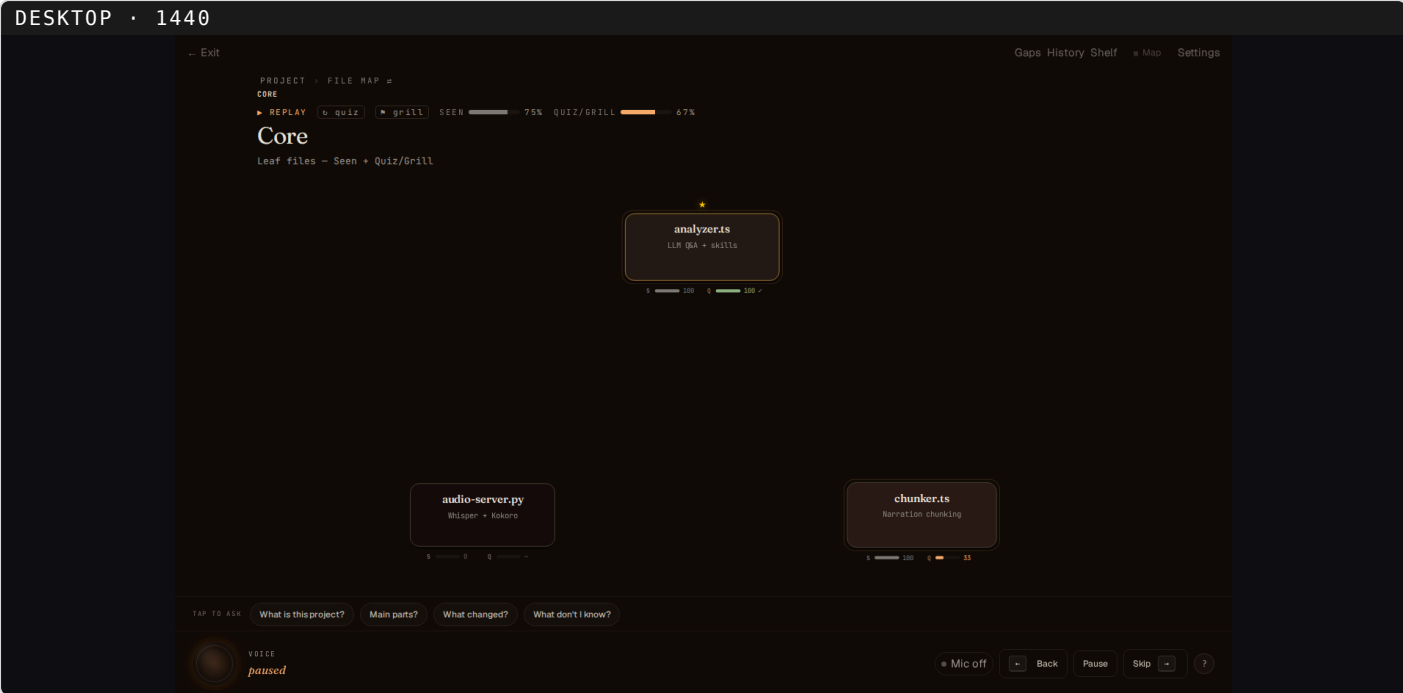

Two axes, both rolled up over node U descendants. Title block: ▶ replay · ◡ quiz · ▢ grill · SEEN bar (deep briefing-coverage incl. this node — 80% here: 4 of 5 seen) · QUIZ/GRILL bar (the BEST for THIS view only — "-" because the overview was never quizzed; NOT the components' average). Each component shows two side-by-side bars with explicit numbers: S(een) coverage + Q(uitz/Grill) best. Shared S100/Q— ("seen, not proven") is now visibly distinct from Voice S0/Q— ("never seen"). No verbal confirmation; dwell = narration actually finished playing.

Knowledge v3 — drilled to leaf files

scene: knowledge-components

Drilled into Core. Title SEEN 75% (3 of 4 in the subtree seen), QUIZ/GRILL 67% = Core's OWN best quiz (best-for-this-view, not the leaf summary). Leaf files each show their own S/Q bars: analyzer.ts S100 Q100 ✓ (grill-passed), chunker.ts S100 Q33, audio-server.py S0 Q— (never seen / never tested).

Knowledge v3 — weak-spots review loop

scene: weak-spots - review

The actionable "study this" loop: every weak/partial quiz/grill question becomes a row in the review panel on the current layer, tagged by source, with restudy ► and resolve ✓ (resolved items retained for audit). The clear pathway to learn more + the supervisor/QA trail.
